**PROCESSING GUIDELINES**

Reflow Profile Window: The following reflow profile guidelines are intended to provide a window where acceptable coalescence and reaction of the solder paste alloy with base metals to form uniform and continuous intermetallic can occur. They assume that good quality electronics grade materials are used. Please note that the requirements may vary greatly due to the extreme variation in materials that are used in SMT assembly. Proper wetting angles are an indication that an intermetallic has been formed.

Parameter	Guideline	Additional Information
Atmosphere	<b>Air or N<sub>2</sub></b>	Smaller paste deposits or extended range may require nitrogen reflow and/or shorter total reflow time to achieve complete coalescence.
Alloy Melting Point (MP) Range	SAC305: 217 to 221 °C	These values are used to determine some reflow parameters below.
